

Hong Kong JS v5.0

```
var greeter = new Greeter("Hello, world!");
```

JS

Agenda

- Welcome, Housekeeping
- TypeScript & Angular by **Bart Verkoeijen**
- **Beer Break :)**
- Announcements
- React Native & Tools by **Kevin Bluer**
- Q&A & Wrap Up

Housekeeping

Housekeeping

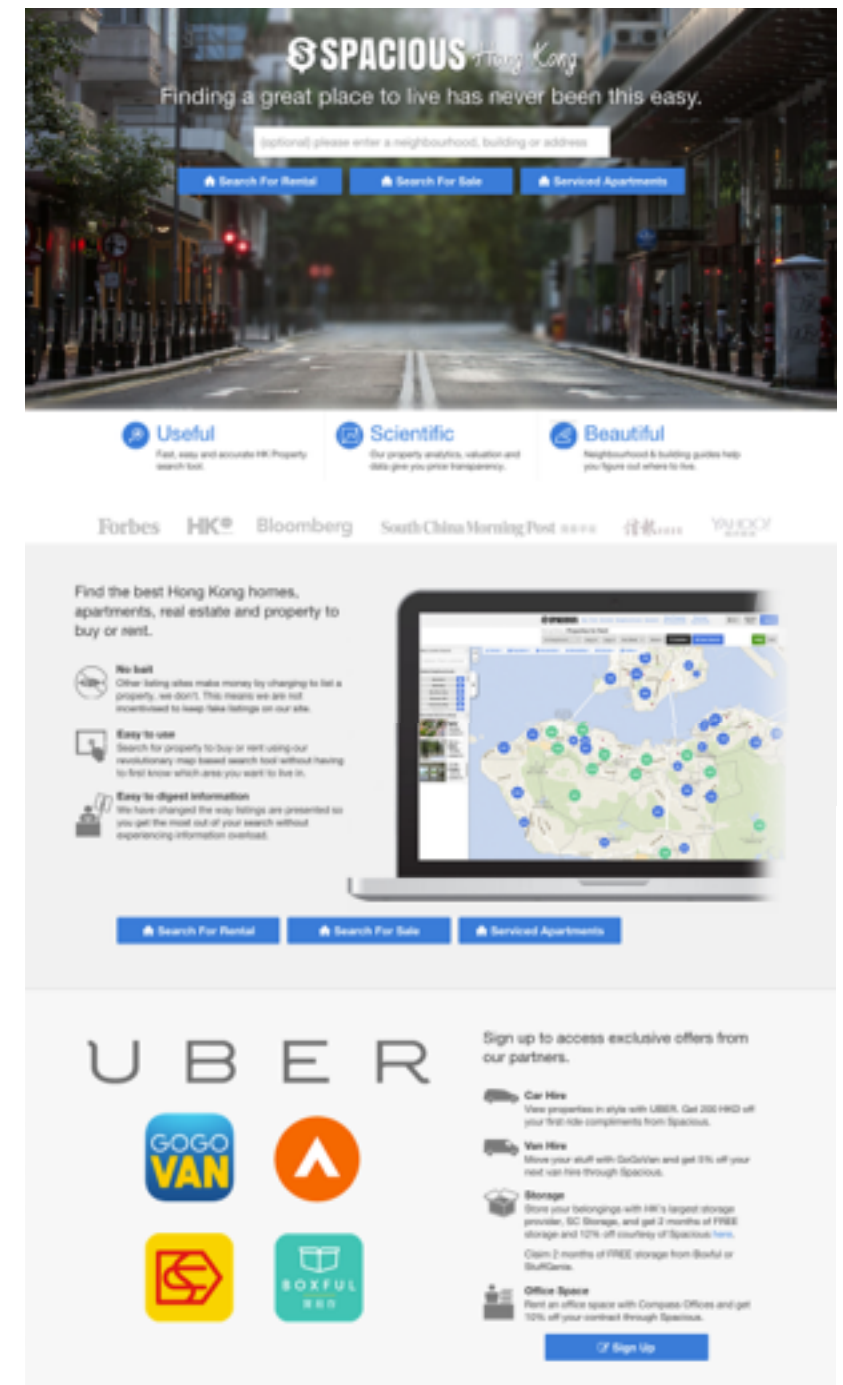

- Questions...anytime :)
- Restrooms :))
- Drinks courtesy of Spacious & Industrie IT :)))

MEETUP SPONSOR

find homes and apartments in Hong Kong

- One of HK's hottest startups
- Find under valued property (including rentals!)
- **Sign up at spacious.hk** and get notified on buildings you want to monitor
- **Rapid regional expansion** outside of HK into Taipei, Shanghai, Singapore
- We use Ruby On Rails and Javascript
- Always on the look out for talented dev's. All offers include equity options. Email asif@spacious.hk with your CV

MEETUP SPONSOR

We help all types of companies from enterprise to start-ups bring to life digital platforms that change the way we live.

- +160 employees across Australia and Hong Kong
- Fully integrated provider from UX, backend, frontend, mobile, dev ops
- We are working on exciting projects in HK and **looking for client side and server side software engineers to join the team fast!**
- Email andrew.debruijn@industrie.com

TypeScript & Angular

- ◎ Email me at kevin@bluer.com if you want to help
- ◎ Next check-in next Friday 17th

React Native + Tools

Kevin Bluer

Agenda

- Goals
- Overview & Reactive Native
- Getting Started & Development Experience
- Demos
- Backend Integration
- React Native Versus...
- Summary + Next Steps

Show of hands...

Mobile Web?

Hybrid?

Native?

- Experiences good / bad / ugly?
- Heard of React Native?
- Any goals with getting to know?

Session Goals

- Some insight into how it works
- Compare and contrast to other approaches
- Impart some of my personal experiences
- **To inspire you to give it a try :)**

React Native Overview

Overview

- New way to create native iOS apps (with Android coming soon) using JavaScript
- Open Source project created by Facebook (<http://facebook.github.io/react-native>)
- Differs from traditional hybrid approaches in that it leverages real native components, as opposed to an embedded browser
- Builds on ReactJS development model (which I'm still learning)

In the wild?

- ◉ Who's using it? Facebook (with Groups App)
- ◉ Industry Commentary...

I say with confidence as a former UIKit author: React's model for the UI layer is vastly better than UIKit's. React Native is a *huge* deal.

The best thing about React Native is non obvious. Four words: No compilation, instant refresh. What to do with all that free time?

3:32 AM - 29 Jan 2015 📍 Queens, NY, United States

Similarities to React JS

- Specify views as functions of data
- Creating "Shadow" Views / Elements and only updates what's changed based on a diff algorithm

```
1  var React = require('react-native');
2  var { AppRegistry, Image, Text } = React;
3
4  var App = React.createClass({
5    render: function() {
6      return (
7        <View>
8          <Image src={require('image!hello')} />
9          <Text>Hello World!</Text>
10        </View>
11      );
12    }
13  });
14
15  AppRegistry.registerComponent('helloworld', () => App);
```

```
21  render: function() {
22    return (
23      <div className='appContent'>
24        <h1>Welcome to Horizon Mobile Admin</h1>
25        <p>Select a section from the top-navigation to begin
26      </div>
27    );
28  }
29  });
```

Characteristics #1

- **Many Native iOS Components supported**

- E.g. UITabBar, UINavigationController
- Each of them have their React Native counterpart (e.g. TabBarIOS, NavigatorIOS, etc)

- **Asynchronous Execution**

- “All operations between the JavaScript application code and the native platform are performed asynchronously”
- Which means things are fast and responsive

TabBar

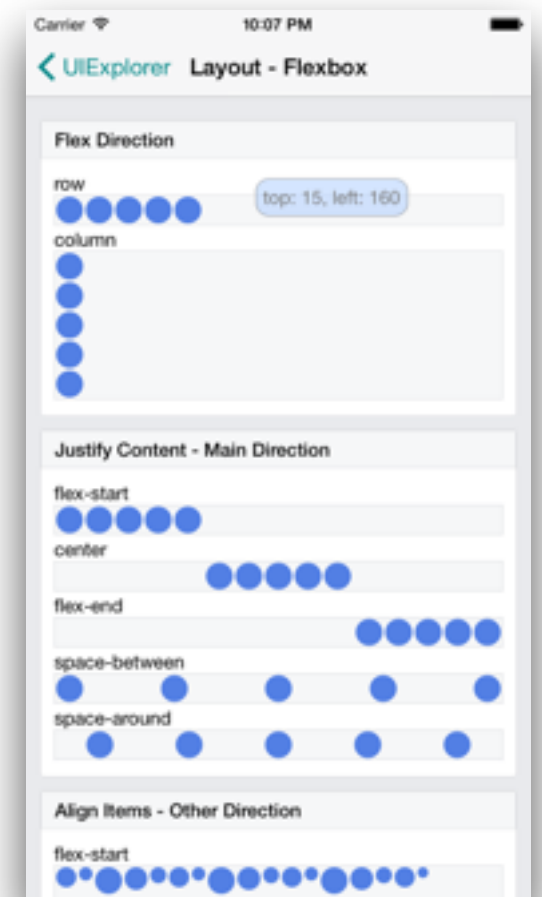

Characteristics

● Flexbox and Styling

- Makes it simple to build common UI elements
- Also supports common web styles via the StyleSheet abstraction (which can be applied inline)

● Polyfills

- React Native is just the “view”
- For the rest we can use additional libraries that work with the API's exposed via React

Flexbox

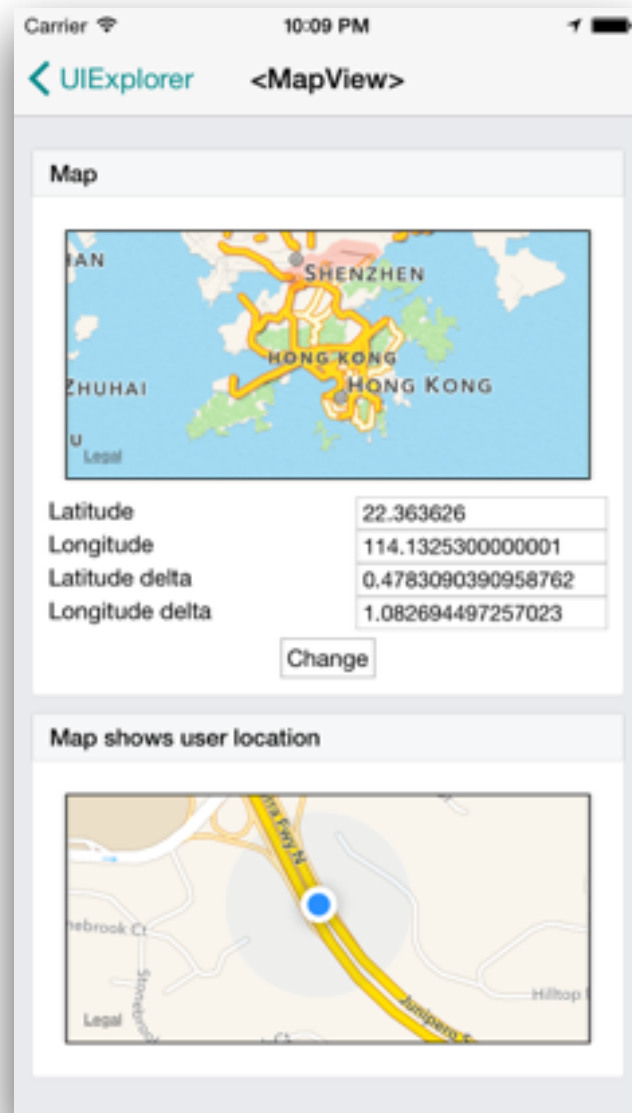

JS

Additional Characteristics

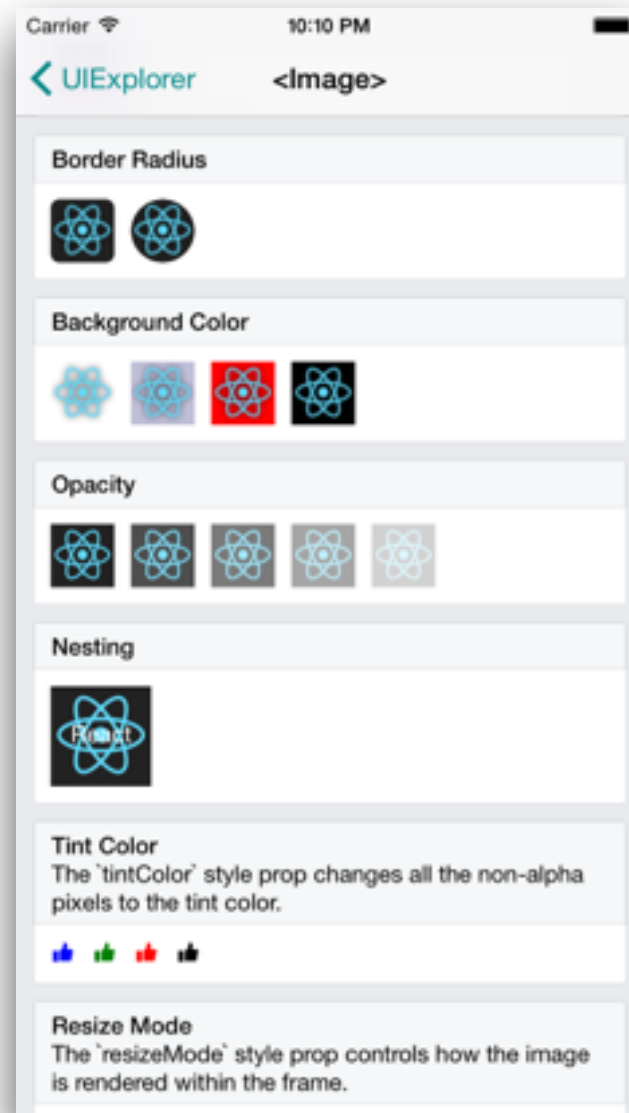

- **Extensibility**

- You can bridge between native views and modules
- Also a library of components is emerging (similarity to Cocoa Pods): <http://react.parts/native-ios>

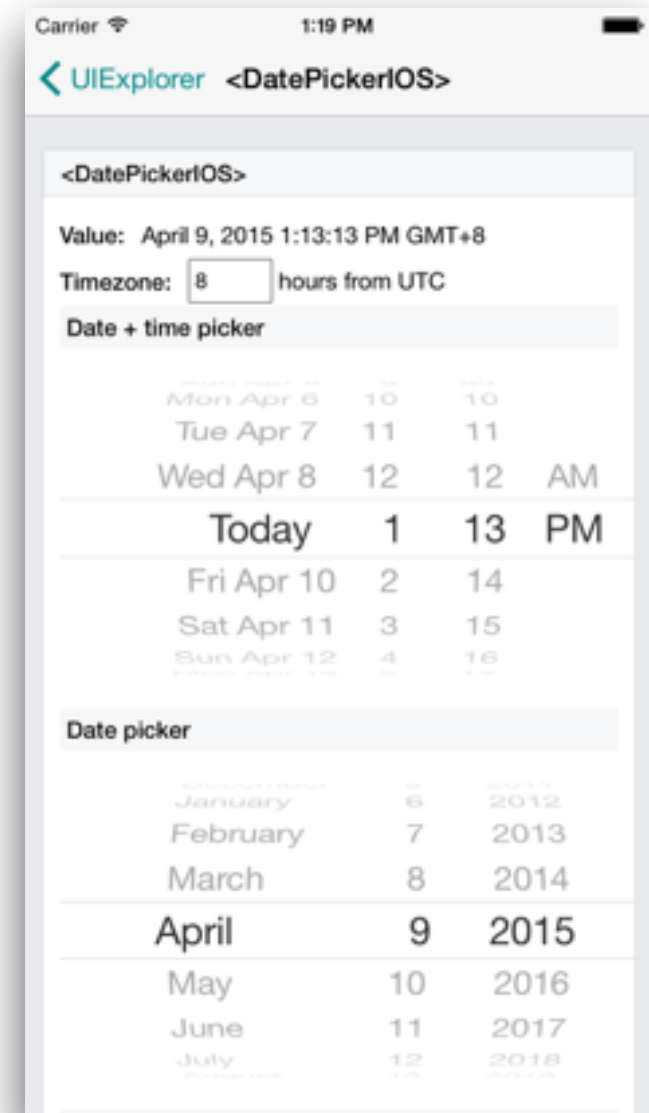

Component Examples

MapView

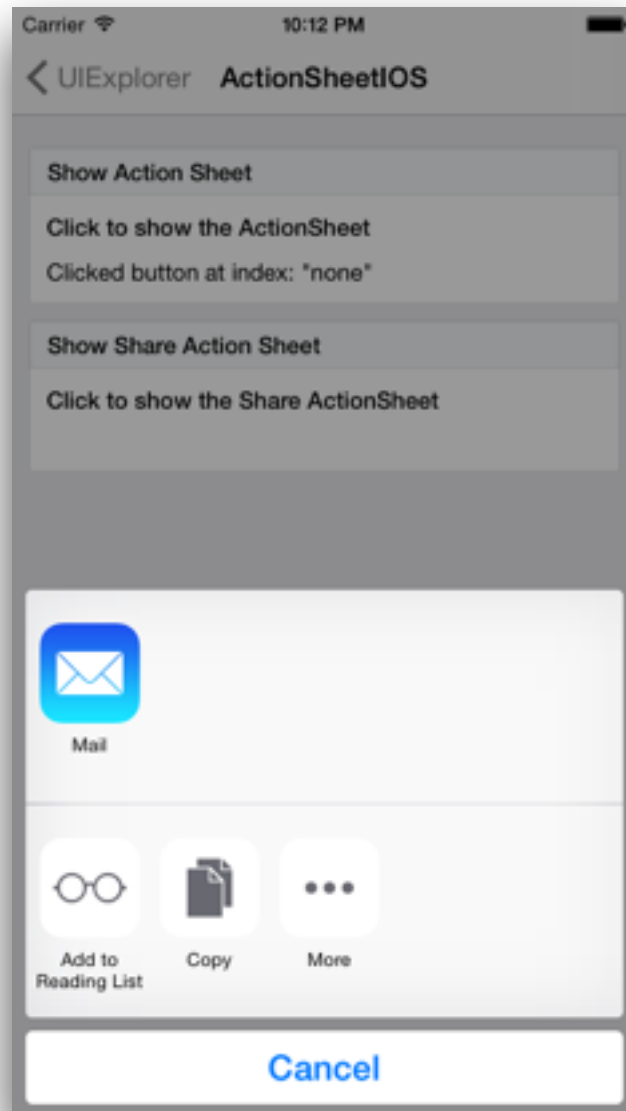

Images

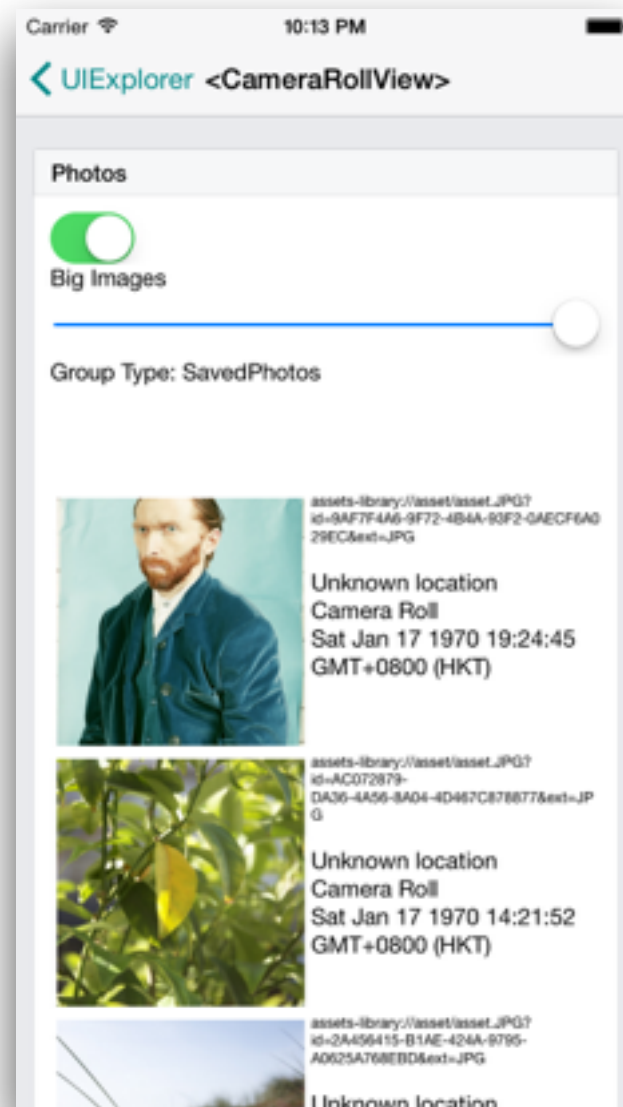

DatePicker

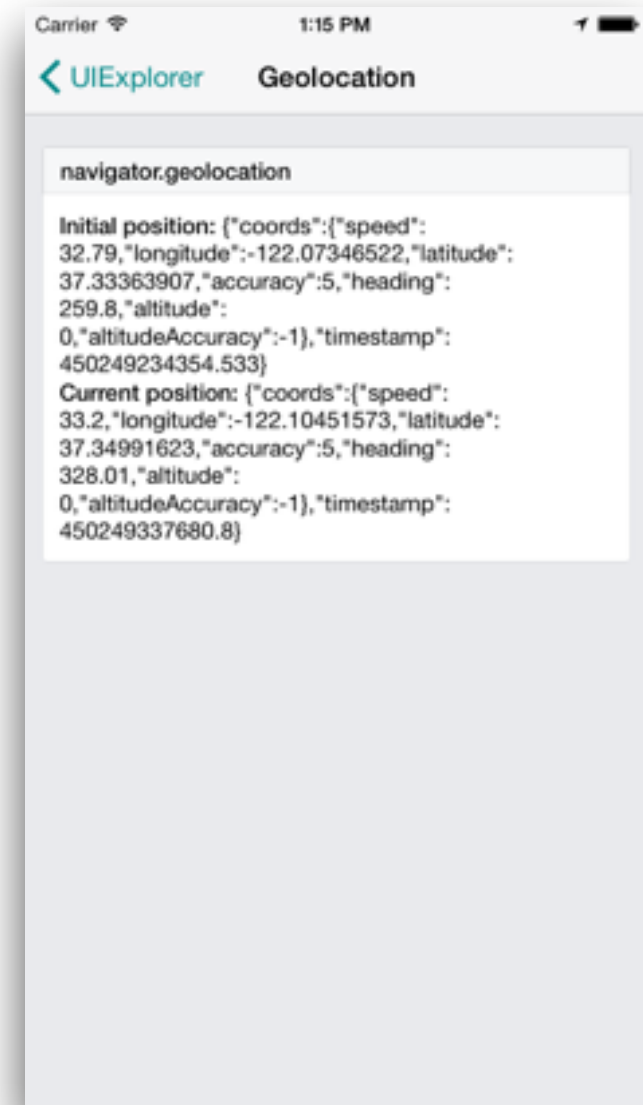

API Examples

Action Sheet

Camera Roll

GeoLocation

Getting Started & Development Experience

Getting Started

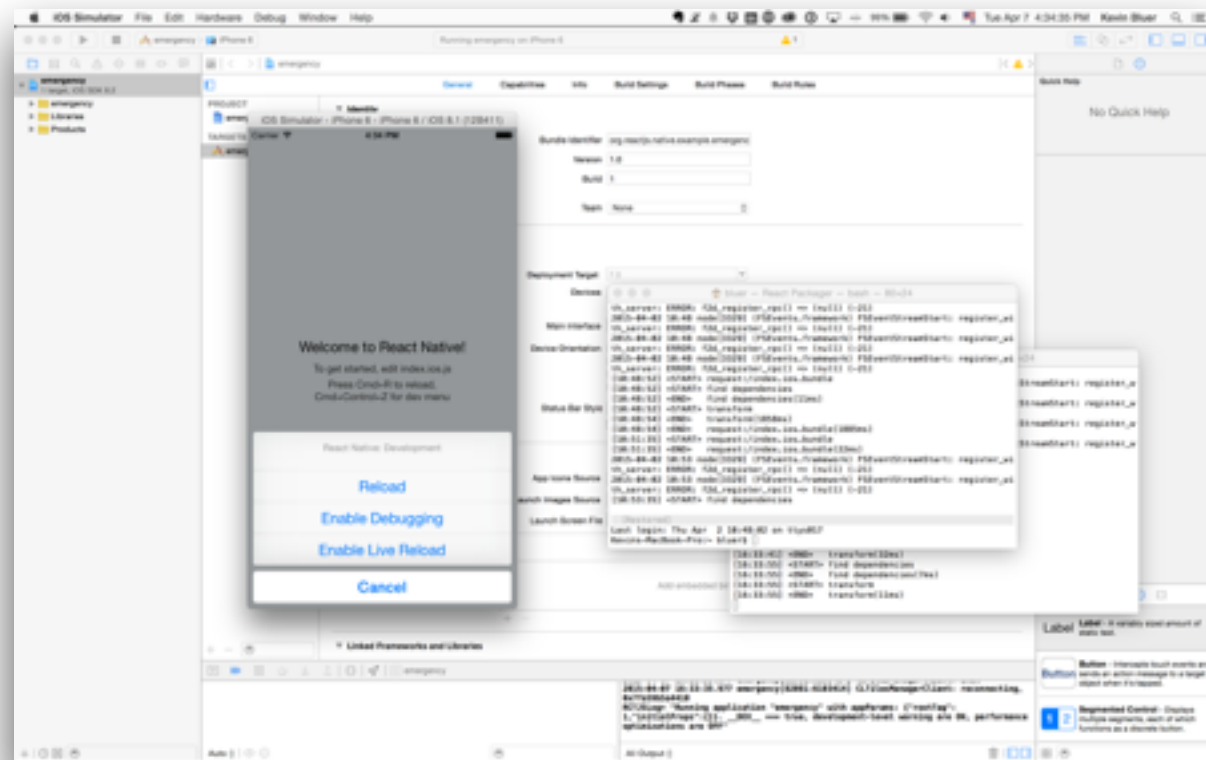

- Mac only for now (given it's dependency on Xcode)
- Requires Node (and optional Watchman and Flow)
- Your first project...

```
$ npm install -g react-native-cli  
$ react-native init AwesomeProject
```

```
drwxr-xr-x@ 6 bluer  staff   204 Apr  2 09:49 AwesomeProject.xcodeproj  
drwxr-xr-x  9 bluer  staff   306 Apr  2 10:22 iOS  
-rw-r--r--  1 bluer  staff  2423 Apr  2 10:20 index.ios.js  
drwxr-xr-x  4 bluer  staff   136 Apr  2 09:48 node_modules  
-rw-r--r--  1 bluer  staff   208 Apr  2 09:48 package.json
```

Running

- Once created open in Xcode and Run
- Cmd + Ctrl + Z for additional options such as Debugging and Live Reload

Adding Components

- Used referencing the required component as follows...

```
7  var React = require('react-native');
8  var {
9    AppRegistry,
10   Image,
11   ListView,
12   StyleSheet,
13   Text,
14   View,
15 } = React;
```

- 3rd Party Ones Installable via NPM :)

```
● npm install react-native-video --save
```

Demos & Hello World!

Demos

- ◎ **UIExplorer**
- ◎ You decide :)
 - ◎ Todo
 - ◎ 2048
 - ◎ Hacker News

Hello World!

Hello World :)

- Create an empty project

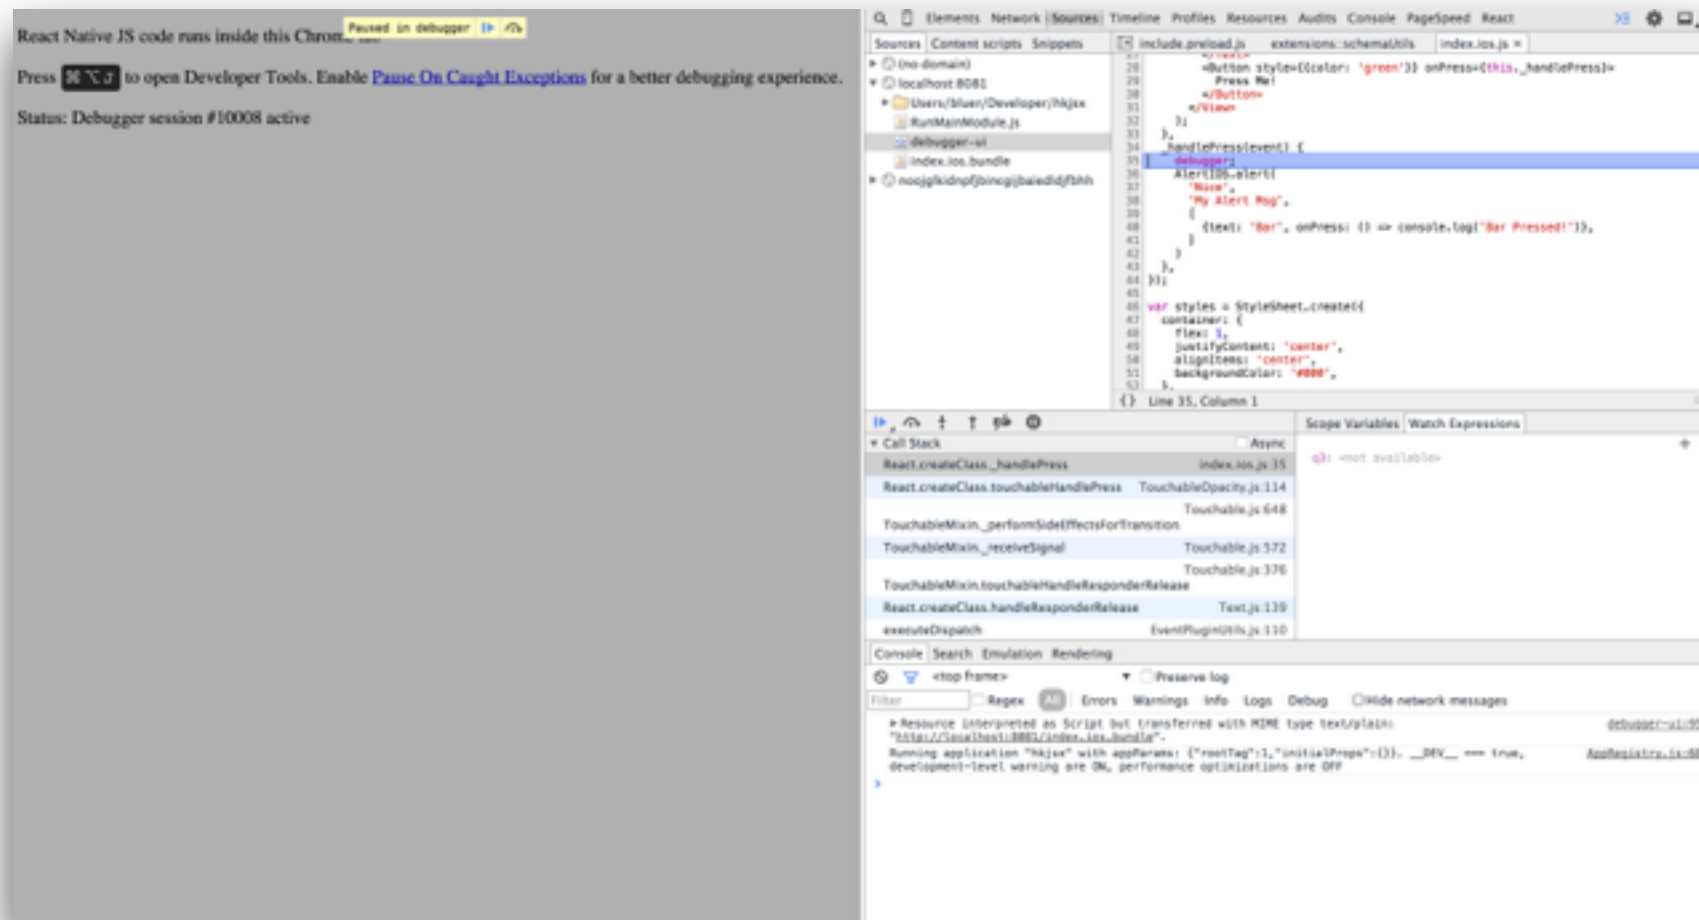

```
react-native init hongkongjs
```

- Add a component via npm (<https://github.com/ide/react-native-button>)

```
npm install react-native-button --save
```

Debugging

- Can be done in Chrome
- Started within the app itself (via Cmd + Ctrl + Z)

Packaging for Deployment

- Simply re-reference the bundle (versus the internal “webserver”)
- Switch the appropriate line AppDelegate.m

```
$ curl 'http://localhost:8081/index.ios.bundle?  
dev=false&minify=true' -o iOS/main.jsbundle
```

Backend Integration

Backend Integration

- By definition it plays nicely with any RESTful API
- However, Parse React just out :)
- Parse (similarly to Firebase) is a seriously good compliment in that it provides
 - Core Data
 - Cloud Code
 - Push
 - Analytics
- It's also owned by Facebook so I wouldn't be surprised to see tighter ever integration

React Native Versus...

Versus Ionic (and Hybrid)

- I'm torn as Ionic has been evolving incredibly fast recently (with some great innovations such as Push, Creator, View, Deploy)
- Performance has also been reasonable
- Also I know native components is on the roadmap

Versus “Pure” Native

- Theoretically minimal performance loss, although time / experience will tell
- Arguably significantly less complexity than writing pure native iOS and Android (and other)
- As always for graphically intensive / cutting edge work (e.g. latest API's) pure native is optimal

The Future

The Future

- Already a lot of activity
 - TouchID support
 - SQLite3 bindings
 - Camera and Video
 - Pull Down to Refresh :)
- We're already seeing a lot of components
 - <http://react.parts/native-ios>
- Exciting to follow :)

Takeaways

Takeaways

- It works!
- It doesn't cover every application type, but a good number (social, news, e-commerce, etc)
- Still weighing up how it stacks up against pure hybrid frameworks such as Ionic or TouchstoneJS
- **Powerful skill to start adding to your repertoire (and adds an ever stronger case for ReactJS)**

Next Steps

Next Steps

- Get it installed
- React Dev Tools (<http://fb.me/react-devtools>)
- Check out some sample projects
 - <https://github.com/iSimar/HackerNews-React-Native>

Q&A

Next Month - MEAN + JS Tools
